Game Jam 03

Group member:Jian Luo, Hao Yuan

This game, created with the tool Bitsy, is an adaptation of the Sherlock Holmes short story A Scandal in Bohemia. I've set the entire story inside a virtual computer world.

Players take on the role of Sherlock Holmes, who is hired by a king to retrieve a photograph of himself and Irene Adler. To track down the hidden photo, players collect a battery to unlock the entrance, find a key, search for clues in the study, and trigger a simulated fire alarm. But what they find at the end is not the photograph — it is a letter. The letter reveals that Irene saw through the whole plan from the very beginning. She kept the photo only to protect herself, not to ruin the king's upcoming marriage.

My core goal for this game is to let players take part in the investigation firsthand, by exploring rooms and piecing together clues on their own. I kept the pixel art style, matching color palette and soundtrack to build a mysterious, slightly uneasy atmosphere. I want players to feel curious at the start, gain a sense of satisfaction as they work through each puzzle, and be genuinely surprised by the final twist.
